
**When cocaine is injected, smoked, or snorted, it is
carried through the blood into the BRAIN.**

**(USE WITH INTERACTION OF DRUGS/ALCOHOL AND
SCHIZOPHRENIA/MENTAL ILLNESS)**

***Note:** Group leaders should prepare this hand-out using a sketch of a person who is smoking or ingesting a drug and arrows to show the path that a smoked substance takes throughout the body. The point here is to show that once the drug is ingested, it travels around the body and gets to the brain. This hand-out should match the title on the form, but it can be tailored to the specific needs of the group or patient population.*
